

ABSTRACT

[0023]

The invention relates to a molded decorative film that can be foam-backed and that is used in the passenger compartment of motor vehicles. Said decorative film is provided with a break line that is defined by a notched weakening in cross-section in the airbag penetration area. Said weakening in cross-section is formed by an internal notch that is closed at both ends by the material of the decorative film. Preferably, a notch is produced that extends on the side that can be foam-backed to the surface of the film and the notch is then closed on said side by welding.
